# 研究成果報告書刊行にあたって

光電相互変換デバイスシステム研究開発センター

所長 山口 敦史

金沢工業大学「光電相互変換デバイスシステム研究開発センター」での令和3年度（令和3年4月ー令和4年3月）における研究成果を、ここに報告書として取りまとめましたので、謹んでお届け申し上げます。

当研究開発センターは、平成12年度の文部省（現文部科学省）の私立大学ハイテク・リサーチ・センター整備事業（研究期間5年）に選定され、金沢工業大学の附置研究所として設立されました。当センターは、エレクトロニクス分野のインテグレーション技術が生み出すデバイスシステムの研究開発を目的として、昭和59年に開設した電子デバイスシステム研究所を母体として、開設以来15年の間に最重点研究領域として成長した光電相互変換デバイスシステム開発に集中・特化し、組織の再編と施設の強化を図り革新的に発展させたものであります。専用研究棟（40号館）を金沢工業大学野々市キャンパス内に新築し、既設設備の移設や新規設備の搬入を終え、平成13年3月から「酸化物半導体の価電子制御と高導電率化およびデバイスへの応用」及び「次世代電子ディスプレイシステムの開発」2つの研究プロジェクトが本格的に活動を開始しました。平成16年3月に両プロジェクトの成果を報告書としてまとめて報告し終了しました。引き続き、平成17年度の私立大学学術研究高度化促進事業（研究期間3年）に選定され、「環境調和型光電相互変換デバイス技術の確立とその応用」並びに「環境調和型電子ディスプレイシステムの開発」の2つのプロジェクトを実施し、平成20年3月に両プロジェクトの成果を報告書としてまとめて報告し終了しました。また、平成23年度の「私立大学戦略的研究基盤形成支援事業」に選定され、設立された電気・光・エネルギー応用研究センターに所属して光・電子デバイスシステムの開発研究を実施しています。平成29年3月末に、研究所設立時より長期に渡り所長を務めてこられた南教授が所長を退任され、平成29年4月より山口敦史が所長の職を引き継いでおります。

本報告をご覧くださる諸賢のご忠告やご助言をお願いする次第であります。今後とも皆様方のご理解とご支援を心からお願い申し上げます。

終わりにあたり、本センターの研究に対し、種々のご支援・ご協力を頂いた関係機関、並びに委託研究や奨学寄付金を提供して頂いた多くの民間企業各社に対し、深く感謝申し上げます。

令和4年3月

## FORWARD

This research report is issued annually to summarize the research activities in the Optoelectronic Device System Research and Development (OEDS R&D) Center, Kanazawa Institute of Technology (KIT). This report, which covers the activities in the OEDS R&D Center from April 2021 to March 2022, is distributed to researchers engaged in the study of materials, devices and systems in the field of electronics, especially optoelectronics, in order to stimulate mutual exchange of scientific information. We believe that this report represents our continuing commitment toward achieving and maintaining research excellence in the area of materials, devices and systems for optoelectronics.

Historically, the Electron Device System (EDS) Research Laboratory was established at KIT in June 1984. Professor Ichiro Fukuda was installed as the first director of the EDS Research Laboratory. Since the establishment of the EDS Research Laboratory, research has centered on fundamental studies of materials, devices and systems as well as on technology to integrate them into electronic devices. In the past 15 years, optoelectronic device system research has grown into a major research field. For the purpose of focusing on the development of optoelectronic device systems, the EDS Research Laboratory was transformed into the OEDS R&D Center attached to KIT in May 2000 with a regrouping of the staff and construction of a new building (building 40). The OEDS R&D Center was financially supported in part by a High-Tech Research Center Project Grant from the Ministry of Education, Culture, Sports, Science and Technology of Japan, and Professor Tadatsugu Minami was appointed the first director of the OEDS R&D Center. There are two important research projects in the OEDS R&D Center: the development of 1) Oxide Electronics and 2) Next Generation Electronic Display Systems. We are extensively investigating new n- and p-type oxide semiconductors for optoelectronic devices, new oxide phosphors for emissive displays, new optoelectronic devices and new display systems. These research projects were successfully finished in March 2008.

After that, we have jointed a new research project in the Center for Electric, Optic and Energy Applications attached to KIT and started in April 2011: Research and development of optoelectronic device systems. A part of our works was financially supported by a Program for the Strategic Research Foundation at Private Universities from the Ministry of Education, Culture, Sports, Science and Technology of Japan. In 2017, Professor Minami, who served as director for a long term since the establishment of the center, retired from the position of director, and Professor Atsushi A. Yamaguchi has taken over the position.

All of us at the OEDS R&D Center are grateful for the generosity and continuing support of the organizations and companies which have been providing research funds.

Atsushi A. Yamaguchi, Director  
Optoelectronic Device System R & D Center  
March 2022

## 研究スタッフ

光電相互変換デバイスシステム研究開発センターは、新しい光電相互変換デバイスの開発を目的として、7名の研究員体制にて平成12年度から研究開発を開始した。これまでに、石井 恂 教授、得永嘉昭 教授、福田一郎 教授、南 内嗣 教授及び坂本康正 教授がご退職された一方で、平成23年度に山口敦史 教授を、平成30年度に平間淳司 教授、柳橋秀幸 講師を、令和3年度には横谷哲也 教授を新たに迎え、所長を含む以下の計6名の所員が研究テーマを分担して研究開発を行っている。

### 令和3年度研究所組織

#### ・研究所員

所長	山口敦史	教授・理学博士
所員	平間淳司	教授・工学博士
所員	宮田俊弘	教授・博士（工学）
所員	横谷哲也	教授・博士（理学）
所員	深田晴己	准教授・博士（工学）
所員	柳橋秀幸	講師・博士（工学）

## 各研究テーマの概要

### 山口研究室 (Yamaguchi Laboratory)

Optical Properties of III-nitride materials and devices are investigated both experimentally and theoretically. The following two topics are intensively being studied at present.

#### *[1] Optical Gain Characteristics of InGaN Green-Emitting Laser Diodes*

We theoretically predicted in 2006 that the utilization of semi polar GaN substrates is beneficial to realize high-performance and low-cost green laser diodes. Now, we are performing more realistic calculation of optical gain characteristics to design the device structure in detail. In addition, experimental studies have just been launched to measure the anisotropic optical gain characteristics of semipolar-oriented InGaN quantum wells.

#### *[2] Optical Characterization of GaN Substrates for High-Efficient White LEDs*

High quality GaN substrates with low defect density and small residual strain are required for high-efficient white LEDs. We are measuring time-resolved photoluminescence spectra to elucidate defect density and to investigate carrier dynamics. 2D-strain mapping measurements by low-temperature micro-reflectance are also being carried out to understand the strain relaxation mechanism and to reduce the residual strain in the substrates.

### 平間研究室 (Hirama Laboratory)

#### *[1] New SPA based (wasabi) plant factory with optimally controlled cultivation environment utilizing the leaf electric potential*

For plants that are considered difficult to grow in plant factories (wasabi), a controlled cultivation environment that was created with IoT based sensor and actuator networks and cloud management was implemented early on.

By analyzing the weak leaf electric potentials from the wasabi when exposed to external environmental stimuli, a “health check” on the wasabi is performed. In addition to growth environmental control based on other biometric SPA (Speaking Plant Approach) measurement techniques, continuous health monitoring of the wasabi using the leaf electric potential data is also obtained in order to further optimize the cultivation environmental control.

#### *[2] Small scale low magnetic field MRI device development*

In this laboratory, a low magnetic field small scale MRI device is under development. It is intended to be used for medical diagnostics immediately after brain surgery. This high quality light weight MRI system is being implemented in collaboration with the Applied Electronics laboratory (AEL) using technology and techniques developed at KIT.

In addition, a low magnetic field 52mT MRI system is also being developed mainly to analyze the internal makeup of food by measuring the relaxation time from MR images.

*[3] Small scale high sensitivity FGM development*

A small sized magnetic sensor (Fluxgate Magnetometer: FGM) with highly sensitive magnetic saturation characteristics that can operate at room temperature was developed. Up until now, an ultra-high sensitivity of  $30\text{pT}/\sqrt{\text{Hz}}$  was achieved. The focus of the research from now is to rebuild and reduce the size of the sensor body while simplifying the magnetic detection circuit.

宮田研究室 (Miyata Laboratories)

We are extensively investigating new n- and p-type oxide semiconductors for optoelectronic devices, new oxide phosphors for emissive displays, new optoelectronic devices and new display systems. A new research project was started in May 2007: Development of indium substitute materials for a transparent conducting electrode. This research was financially supported in part by the Rare Metal Substitute Materials Development Project initiated by the Ministry of Economy, Trade and Industry of Japan and transferred to the New Energy Development Organization from April 2008; the research project was completed successfully in March 2009. A new research project was started in August 2010: Development of low cost and high quality transparent conducting oxide (TCO) films by sputtering deposition. The research was financially supported in part by the New Energy and Industrial Technology Development Organization (NEDO), Japan, via the Photovoltaic Power Generation Technology Research Association (PVTEC), Japan; the research project was finished successfully in March 2013.

*[1] Preparation and device application of intelligent oxide thin films.*

Highly conductive and transparent thin films have many applications such as transparent electrodes for optoelectronic devices and transparent heat mirrors for solar energy utilization. Although indium tin oxide (ITO) films are in practical use, ITO is a relatively expensive material because indium is in rather limited supply. We have proposed use of new transparent conducting oxide (TCO) materials, consisting of ZnO and multicomponent oxide. Especially, the following subjects are in progress:

- 1) Development of new TCO materials and its deposition techniques.
- 2) Development of new p-type oxide semiconductors and its deposition technique.
- 3) Development of optoelectronic devices using new oxide semiconductors.
- 4) Development of sensor and MEMS using new oxide semiconductors.

*[2] Photovoltaic application of oxide semiconductors.*

We have proposed new p–n heterojunction solar cells have been fabricated using cuprous oxide ( $\text{Cu}_2\text{O}$ ), a semiconductor with a direct energy gap of 2.1 eV. The significantly enhanced efficiencies could be achieved in Al-doped ZnO (AZO)/n-type semiconductor/p-type  $\text{Cu}_2\text{O}$  heterojunction solar cells fabricated by preparing an oxide semiconductor thin film on a thermally oxidized p- $\text{Cu}_2\text{O}$  sheet using low-damage and low-temperature deposition techniques. The following subjects are in progress:

- 1) Development of new oxide semiconductor thin films materials as an n-type layer and its deposition techniques.
- 2) The  $\text{Cu}_2\text{O}$  homojunction was formed by epitaxially growing an impurity-doped  $\text{Cu}_2\text{O}$  thin film on thermally oxidized polycrystalline p-type sodium-doped  $\text{Cu}_2\text{O}$  sheets by electrochemical deposition (ECD) method.

### 横谷研究室 (Yokotani Laboratory)

We have promoted researches of the Internet of Things (IoT) and related subjects by two approaches, i.e., vertical and horizontal approaches.

#### *[1] Researches by the vertical approach*

We focus specific applications with IoT technologies. Then, we recognize social problems and requirements, proposes solutions, and verify effectiveness of their solutions by several methods, e.g., prototyping, computer simulation and mathematical analysis. We list applications and their research activities as follows.

##### (1) Building Automation and Control System (BACS) as a cyber physical system

The Internet technologies have been applied to BACS for enhancement of connectivity of various devices and cost reduction. However, in this situation, the threat of cyber-attack is one of major concerns. Generally, this threat causes to damage physical facilities. We intend to evaluate a threat by traffic analysis on computer simulation and inferences of this threat on hardware emulation.

##### (2) Surveillance system by using poles

Electric poles have been deployed widely along roads. We intend to configure distributed basement for some applications using these poles. One of typical applications is the surveillance system on roads. We deploy this system using poles with surveillance cameras by video signal processing, AI, and network technologies. We evaluate this system and some embedded algorithms in this system in the experimental station of KIT Hakusan mountain campus.

In addition to these applications, we have investigated some applications, e.g., wildlife monitoring and factory monitoring.

## *[2] Researches by the horizontal approach*

We have promoted R&D and standardization of IoT platforms focusing on network technologies. We have focused on two type platforms, i.e., the access network platform and service network platform as follows.

### (1) Access network platform

In IoT applications, a number of end devices transfers tiny data blocks with high frequency. Some applications require low latency communication. In this situation, seamless communication between end points should be deployed for various IoT applications. We propose traffic control mechanisms with cooperation between optical networks and 5G networks. Especially, we propose active traffic control mechanisms with real time traffic monitoring. We also verify their control mechanisms by mathematical analysis and computer simulations.

### (2) Service network platform

The current Internet does not seem to be suitable architecture for most of IoT applications, because the Internet causes large protocol overhead and heavy processing resources to transfer tiny data blocks in IoT applications. Therefore, we propose that the Information Centric Network (ICN) technologies are applied to communication for IoT applications. ICN does not require IP base routing and provides simplified communication sequences. We research the IoT platform as the service network platform using ICN and emerging technologies for this platform. Moreover, we promote standardization of this platform. We contribute standardization of the IoT Data Exchange Platform (IoT-DEP), ISO/IEC 30161 series standardized by ISO/IEC JTC1/SC41.

## 深田研究室 (Fukada Laboratory)

### *[1] Development of thin film phosphor materials*

Our objective is the development of thin film phosphors with high efficiency and chemical stability for inorganic thin-film electroluminescence devices and white light-emitting diodes. Various phosphor thin films are prepared by a sol-gel dip coating followed by post annealing at a high temperature. In addition, we will conduct studies on inorganic-organic hybrid phosphors and luminescent devices utilizing these phosphors.

### *[2] First-principles molecular-dynamics calculations*

The first-principles molecular-dynamics simulation is an effective method of explaining and predicting various properties of semiconductors and metals through electron-state calculations based on quantum dynamics. Aiming at the improvement of the experimental conditions in the preparation of inorganic or organic semiconductors and/or the development of new optoelectronic devices, we will conduct exploring and predicting physical phenomena on the atomic and electronic levels.

## 柳橋研究室 (Yanagibashi Laboratory)

### *[1] Development of SPA typed mushroom factory*

The final goal of our study is actual operation of SPA (Speaking Plant Approach) typed mushroom factory. SPA means environmental control using some biological information as index. In this study, bioelectric potential responses of mushrooms to various environmental factors have been measured and associated with their morphogenetic properties. Mushroom growth promotion by bioelectric potential activation has also been tried and it is gradually becoming clear that bioelectric potential is effective as an index of growth control.

### *[2] Contactless measurement of plant physiological activity using magnetic fluid*

This study is the world's first trial aiming to realize a quite new method to measure plant physiological activity without physical contact of sensors. It is considered that nano particle sized magnetic fluid is absorbed into the plant body and its movement by solution transport related to plant physiological activity will result in extremely weak magnetic fluctuations that seems to be detectable without contact by FGM. In the future, we will also work on the application of this measurement technology on medical scene.

光電相互変換デバイスシステム研究開発センター

令和3年度 研究所年報 第22巻

令和4年7月 発行

**OPTOELECTRONIC DEVICE SYSTEM R&D CENTER**

**Annual Research Report Vol.22**

**April 1, 2021 ~ March 31, 2022**

発 行 者 : 金沢工業大学 光電相互変換デバイスシステム研究開発センター

〒921-8501 石川県野々市市扇が丘 7-1 TEL : 076-248-1100

**Publisher : Kanazawa Institute of Technology**

**Optoelectronic Device System Research and Development Center**

7-1 Ohgigaoka, Nonoichi, Ishikawa 921-8501 TEL : +81 76-248-1100
